

Florbot v1.0 User Operating Guide

Document Date: Aug 2026

Software Version: 1.0 Stable

Florbot is a lightweight desktop companion developed by Amit to facilitate natural human-computer interaction through an expressive, interactive interface. This guide outlines the operational procedures for interacting with Florbot's HUD systems and emotion-based response architecture.

Initialization and Startup

Upon launching the application (Florbot1.0.py), the companion initializes with a dedicated wake cycle.

- **Initial State:** Florbot begins in **Sleeping Mode**.
- **Visual Indicators:** A specific sleeping animation is displayed, featuring floating "Z" symbols.
- **Activation:** The companion remains in this low-power state until a manual wake command is issued.

Core Interaction Patterns

Florbot utilizes a modular widget-based design, allowing for seamless interaction via mouse input.

Primary Interaction: Left Click

A single Left Click serves two primary purposes based on Florbot's current state:

1. **While Sleeping:** Initiates the wake animation and transitions Florbot to its normal idle state.

2. **While Awake:** Deploys the **Blue HUD**, which functions as a quick-access application launcher.

Integrated Shortcut	Target Application
 Notepad	System Text Editor
 Google Chrome	Web Browser
 File Explorer	System Directories
 VS Code	Integrated Development Environment
 Music Playlist	Default Media Player
 Adobe Illustrator	Vector Graphics Software

Note: Clicking outside the menu perimeter will automatically dismiss the Blue HUD.

Secondary Interaction: Right Click

A single Right Click opens the **Internal Red HUD**, dedicated to system-level interactions and customization.

- **Appearance:** Accesses the visual theme selection menu.
- **Search:** Activates the integrated web query tool.
- **About:** Displays developer information and technical specifications.
- **Sleep:** Manually triggers the sleep cycle and closes all active menus.

Advanced Features and Customization

Visual Personalization

The Appearance menu allows for instantaneous updates to Florbot's aesthetic profile. Available color themes include Blue, Red, Cyan, White, Dark Green, Purple, Orange, Yellow, Pink, and Indigo. Selecting a theme modifies the following elements:

- Outer Ring Color
- Glow Effect Intensity
- Interface Text Color

Integrated Search System

Selecting the Search option opens a dedicated input field. During the processing phase, Florbot performs a Thinking Animation to indicate an active state. Entering a query and pressing Enter will launch the default system browser with a Google search.

Expression and Emotion System

Florbot communicates its internal state through non-verbal visual cues rather than standard text prompts.

- **Idle Behavior:** Features smooth floating movement, natural blinking, and a rotating decorative ring.
- **Crying Emotion:** Triggered by rapid clicking (three or more times). This state represents an error or negative interaction feedback.
- **Recovery:** A single Left Click will comfort Florbot and immediately return it to a happy idle state.

Technical Notes and Tips

- **Desktop Management:** Florbot features "always-on-top" functionality and is fully compatible with multi-monitor professional setups.
- **Keyboard Shortcut:** The default hotkey **Ctrl + Alt + F** can be used to quickly access or launch the companion.
- **Dependency Requirement:** Application shortcuts in the Blue HUD require the corresponding software to be installed on the host machine to function.
- **System Impact:** The architecture is designed for extremely low CPU overhead using reusable animation systems.

For further technical support or installation queries, refer to the Florbot v1.0 Installation & Setup Guide.
